## Object-Oriented Analysis using UML

### Description

Object Orientation, or OO, is a methodology that can be used during the whole software development life cycle: from analysis of users' needs, to design and then coding and testing. The Unified Modelling Language (UML) is an international set of diagrams for modelling your system using an object-oriented approach.

This course will teach you how to analyse and document your system using established OO principles. It will help you to understand the problem and the solution better, and communicate it more effectively. The course will also make it easier to work with developers who use an object-oriented approach.

This course is run in parallel with the first 3 days of the Object-Oriented Analysis & Design using UML course. If you have programming experience, you will benefit more from attending the full 5 days.

### Objectives

After you have completed the Object Oriented Analysis using UML course, you will be able to:

- Understand object-oriented concepts and principles, and the OO project lifecycle.
- Analyse a system in terms of the objects involved.
- Read and write use cases.
- Take part in a design session that uses Class, Responsibilities, and Collaboration (CRC) cards.
- Identify high-level classes and the relationships between them.

### Intended Audience

You should attend the Object Oriented Analysis using UML course if:

- You are a business analyst, project manager or system architect, and you work with developers who use object orientation.
- You need to learn how to read and write use cases.
- You need to understand the object-oriented process.

### Prerequisites

You do not need to have any knowledge of object orientation or programming before attending the Object Oriented Analysis using UML course.

If you are a programmer, then you should rather attend the Object-Oriented Analysis & Design using UML course, which includes this course.
